

CLAIMS

WHAT IS CLAIMED IS:

1. A method of facilitating the use of a software process with one of a plurality of secure repositories, said method comprising the acts of:

providing an interface, said interface being callable by said software process;

if said one of said plurality of secure repositories is said first of said plurality of secure repositories, providing a first set of computer-executable instructions which are invocable by said callable interface; and

if said one of said plurality of secure repositories is said second of said plurality of secure repositories, providing a second set of computer-executable instructions which are invocable by said callable interface, said second set of computer-executable instructions being different from said first set of computer-executable instructions.

2. The method of claim 1, wherein said secure repository converts encrypted data to decrypted data using a cryptographic algorithm to apply a cryptographic key to said encrypted data, and wherein said software process performs an operation on said decrypted data.

3. The method of claim 2, wherein said operation comprises rendering said decrypted data.

4. The method of claim 1, wherein said first or said second sets of computer-executable instructions is provided in the form of an executable file dynamically linkable with said software process.

1 5. The method of claim 1, wherein said interface comprises a first
2 function callable by said software process, said first function being parameterized by
3 first data representative of a type of secure repository.
4

5 6. The method of claim 5, wherein said interface is callable by said
6 software process without regard to whether said one of said plurality of secure
7 repositories is said first of said plurality of secure repositories or said second of said
8 plurality of secure repositories.
9

10 7. The method of claim 1, wherein said interface comprises a second
11 function callable by said software process, said second function requesting that said
12 secure repository perform at least one action.
13

14 8. The method of claim 1, wherein said first of said plurality of secure
15 repositories executes on a closed-platform device, and wherein said second of said
16 plurality of secure repositories executes on an open-platform device.
17

18 9. A method of communicating between a software process and a one of
19 a plurality of secure repositories, said method comprising the acts of:

20 said software process issuing a first interface call which
21 authenticates said software process to said one of said plurality of secure repositories;
22 and

23 said software process issuing a second interface call which
24 requests performance of an action by said secure repository for said software process;
25 wherein said software process issues said first and second interface calls without regard
26 to whether said one of said plurality of secure repositories is a first of said plurality of
27 secure repositories or a second of said plurality of secure repositories.
28

1 10. The method of claim 9, wherein said secure repository converts
2 encrypted data to decrypted data using a cryptographic algorithm to apply a
3 cryptographic key to said encrypted data, and wherein said software process performs
4 an operation on said decrypted data.

5
6 11. The method of claim 10, wherein said operation comprises rendering
7 said decrypted data.

8
9 12. The method of claim 9, wherein said first secure repository
10 comprises a software-based secure repository, and wherein said second secure
11 repository comprises at least some isolated hardware.

12
13 13. The method of claim 9, wherein each of said first and second secure
14 repositories are software-based repositories, said first secure repository having at least
15 one feature not present in said second secure repository.

16
17 14. The method of claim 9, wherein said one of said plurality of secure
18 repositories is said first of said plurality of secure repositories, and wherein said
19 software process issues said first and second interface calls without regard to whether
20 said second repository exists.

21
22 15. The method of claim 9, wherein said first interface call is
23 parameterized by first data representing a first type of secure repository, and wherein
24 said first and said second of said plurality of secure repositories are each of said first
25 type.

26
27 16. The method of claim 15, wherein said software process performs a
28 second action if said one of said plurality of repositories is either said first or said

1 second of said plurality of secure repositories, and wherein said software process does
2 not perform said second action if said one of said plurality of secure repositories is a
3 third of said plurality of secure repositories, said third of said plurality of secure
4 repositories being of a second type different from said first type.

5
6 17. The method of claim 9, further comprising the acts of:
7 dynamically linking to said software process a first set of
8 computer-executable instructions, if said one of said plurality of repositories is said first
9 of said plurality of secure repositories; and
10 dynamically linking to said software process a second set of
11 computer-executable instructions different from said first set of computer-executable
12 instructions, if said one of said plurality of secure repositories is said second of said
13 plurality of secure repositories.

14
15 18. The method of claim 9, further comprising the act of said software
16 process receiving second data in response to said second interface call, said second data
17 being generated by said one of said plurality of secure repositories, wherein said second
18 data does not expose to said software process whether said data was generated by said
19 first secure repository or said second secure repository.

20
21 19. A computer-readable medium encoded with computer-executable
22 instructions to perform the method of claim 9.

23
24 20. A secure repository comprising:
25 a first set of computer-executable instructions which converts
26 encrypted data into decrypted data by applying a cryptographic key to said encrypted
27 data; and

1 a second set of computer-executable instructions which provides
2 said decrypted data to a software process if said secure repository trusts said software
3 process;
4 wherein said secure repository establishes trust of said software process at least in part
5 by establishing trust with an intermediate object, said intermediate object comprising a
6 third set of computer-executable instructions dynamically linked to said software
7 process.

8
9 21. The secure repository of claim 20, wherein said software process
10 renders said decrypted data.

11
12 22. The secure repository of claim 20, further comprising a fourth set of
13 computer-executable instructions which establishes trust with said intermediate object,
14 said fourth set of computer-executable instructions including instructions to perform
15 acts comprising:

16 receiving from said intermediate object first data comprising:
17 second data based at least in part on at least some code
18 contained in said intermediate object; and
19 a signature of said second data; and
20 validating said signature.

21
22 23. The secure repository of claim 22, wherein said second data
23 comprises a hash of said at least some code.

24
25 24. The secure repository of claim 22, wherein said fourth set of
26 computer-executable instructions further performs acts comprising:

27 receiving from said intermediate object second data based at least
28 in part on code contained in said software process.

1
2 25. A method of communicating with one of a plurality of secure
3 repositories, said method comprising the acts of:

4 issuing a first interface call without regard to whether said one of
5 said plurality of secure repositories is a first of said plurality of secure repositories or a
6 second of said plurality of secure repositories;

7 if said one of said plurality of secure repositories is said first of
8 said plurality of secure repositories, dynamically linking with a first set of computer-
9 executable instructions invocable by said first interface call; and

10 if said one of said plurality of secure repositories is said second
11 of said plurality of secure repositories, dynamically linking with a second set of
12 computer-executable instructions invocable by said first interface call, said second said
13 of computer-executable instructions being different from said first set of computer-
14 executable instructions.

15
16 26. The method of claim 25, wherein each of said plurality of secure
17 repositories converts encrypted data to decrypted data using a cryptographic algorithm
18 to apply a cryptographic key to said encrypted data.

19
20 27. The method of claim 25, wherein said first secure repository
21 comprises a software-based secure repository, and wherein said second secure
22 repository comprises at least some isolated hardware.

23
24 28. The method of claim 25, wherein each of said first and second
25 secure repositories are software-based repositories, said first secure repository having at
26 least one feature not present in said second secure repository.

27

1 29. The method of claim 25, wherein said act of performing said first
2 action comprises executing a first set of computer-executable instructions, and wherein
3 said first action comprises the act of providing to said first secure repository first data
4 based at least in part on at least some of said first set of computer-executable
5 instructions.

6
7 30. A computer-readable medium encoded with a second set of
8 computer-executable instructions to perform the method of claim 25.

9
10 31. A method of authenticating a first software process to a second
11 software process, said method comprising the acts of:

12 establishing to said second software process the authenticity of an
13 intermediary object; and

14 using said intermediary object to establish to said second software
15 process the authenticity of said first software process.

16
17 32. The method of claim 31, wherein said second software process
18 converts encrypted data to decrypted data by using a cryptographic algorithm to apply a
19 cryptographic key to said encrypted data, and wherein said first software process
20 performs an operation on said decrypted data.

21
22 33. The method of claim 32, wherein said operation comprises rendering
23 said decrypted data.

24
25 34. The method of claim 33, wherein said first software process is a text-
26 rendering application, and wherein said decrypted data comprises text.

27

1 35. The method of claim 31, wherein said intermediary object comprises
2 a set of computer-executable instructions having a first function callable from said first
3 software process, and wherein the act of establishing to said second software process
4 the authenticity of said intermediary object includes, or is actuated by, the act of said
5 first software process calling said first function.

6
7 36. The method of claim 35, wherein said act of establishing to said
8 second software process the authenticity of said intermediary object includes the act of
9 providing said second software process with a certificate based at least in part on said
10 set of computer-executable instructions.

11
12 37. The method of claim 36, wherein said certificate comprises a signed
13 hash of at least some of said computer-executable instructions.

14
15 38. The method of claim 35, wherein said intermediary object is in the
16 address space of said first software process, and wherein said first function is
17 referenceable by an address within said address space.

18
19 39. The method of claim 35, wherein said set of computer-executable
20 instructions is dynamically linkable with said first software process, and wherein said
21 method further comprises the act of linking said set of computer-executable instructions
22 with said first software process.

23
24 40. The method of claim 31, wherein said intermediary object comprises
25 a set of computer-executable instructions having a first function callable from said first
26 software process, and wherein said act of using said intermediary object to establish to
27 said second software process the authenticity of said first software process includes, or
28 is actuated by, the act of said first software process issuing a call to said first function.

41. A computer-readable medium encoded with a second set of computer-executable instructions to perform the method of claim 31.
